Amendments to the Claims:

A listing of the entire set of pending claims (including amendments to the claims, if any) is submitted herewith per 37 CFR 1.121. This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Original) A method for limiting simultaneous copies of content material, comprising:
 - communicating a copy of the content material to a receiving device,
 - communicating a security challenge to the receiving device when the copy of the content material is communicated to the receiving device, and
 - receiving a security response, based on the security challenge, from the receiving device when the copy of the content material is removed from the receiving device.
2. (Original) The method of claim 1, further including
 - verifying a certification of the receiving device before communicating the copy of the content material to the receiving device.
3. (Original) The method of claim 1, further including
 - maintaining a count of the simultaneous copies of the content material, including:
 - incrementing the count when the copy of the content material is communicated to the receiving device, and
 - decrementing the count when the security response is received from the receiving device, and
 - wherein
 - communicating the copy of the content material is dependent upon the count of the simultaneous copies.

4. (Original) The method of claim 1, further including:
generating a random number, and
encrypting the random number via a public key of a public-private key pair
that is associated with the receiving device to form the security challenge, and
wherein
the security response includes the random number.
5. (Original) The method of claim 4, further including
verifying a certification of the receiving device before communicating the
copy of the content material to the receiving device, and
wherein
the certification of the receiving device includes a public key of the public-
private key pair of the receiving device.
6. (Original) A check-out/check-in device comprising:
a catalog controller that is configured to provide a limited number of
simultaneous copies of content material to one or more receiving devices,
an encrypter that is configured to provide a security challenge to a
receiving device of the one or more receiving devices when the catalog controller
provides a copy of the content material to the receiving device, and
a return verifier that is configured to:
receive a security response from the receiving device when the
copy of the content material is removed from the receiving device, and
notify the catalog controller whether the security response
corresponds to an appropriate response to the security challenge.

7. (Original) The check-out/check-in device of claim 6, further including
a certification verifier that is configured to verify a certification of the
receiving device, and
wherein
the catalog controller is further configured to provide the content material
in dependence upon the certification of the receiving device.
8. (Original) The check-out/check-in device of claim 6, wherein
the catalog controller is further configured to maintain a count of the
simultaneous copies of the content material,
wherein,
the catalog controller is configured to:
Increment the count when the copy of the content material is
communicated to the receiving device, and
decrement the count when the security response is received from
the receiving device, and
provide the copy of the content material in dependence upon the
count of the simultaneous copies.
9. (Original) The check-out/check-in device of claim 6, wherein
the encrypter is configured to encrypt a random number via a public key of
a public-private key pair that is associated with the receiving device to form the
security challenge, and
the return verifier is configured to compare the security response to the
random number to determine whether the security response corresponds to the
appropriate response to the security challenge.

10. (Original) The check-out/check-in device of claim 9, further including
a certification verifier that is configured to verify a certification of the
receiving device, and
wherein
the catalog controller is further configured to provide the content material
in dependence upon the certification of the receiving device, and
the certification of the receiving device includes a public key of the public-
private key pair of the receiving device.
11. (Original) A receiving device that receives content material and a
corresponding security challenge from a check-out/check-in device, comprising:
a memory that is configured to store the content material and the
corresponding security challenge, and
a security device that is configured to:
erase the content material from the memory, and
communicate a security response to the check-out/check-in device,
based on the security challenge that is associated with the content material.
12. (Original) The receiving device of claim 11, wherein
the security device is further configured to communicate a certification of
the receiving device to the check-out/check-in device to enable the check-
out/check-in device to provide the content material to the receiving device.
13. (Original) The receiving device of claim 11, wherein
the security device includes:
a decrypter that decrypts the security challenge via a private key of
a public-private key pair that is associated with the receiving device to form the
security response.

14. (Original) The receiving device of claim 13, wherein
the security device is further configured to communicate a certification of
the receiving device to the check-out/check-in device to enable the check-
out/check-in device to provide the content material to the receiving device, and
the certification of the receiving device includes a public key of the public-
private key pair of the receiving device.
